*Don't confuse air heaters of the 20th century with.....*

# **Technology of the 21st Century**

## **A LONGER LIFE**

Although your existing heater may have served you well, it is probably 25-30 years old and coming to the end of its useful life. We regularly advise on the replacement of heaters over 35 years old. It is probably the only domestic appliance that needs replacing once in a life time.

The life expectancy of a modern wet boiler (radiator central heating system) is around 10 years, only a third of the life of a modern air heater.

## **MORE COMFORT**

Modern warm air heaters with electronic controls provide stable room temperatures, greater comfort conditions and improved fuel efficiency, all combined with smoother, quieter operation. No more cold spots and draughts that are characteristics of older systems.

## **SAVE MONEY**

It is likely that your existing heater was manufactured to use Towns Gas and converted to use Natural Gas, losing efficiency in the process.

Modern air heaters have intelligent control systems that monitor the control of the appliance ensuring the most efficient operation. Field trials have shown savings up to 18% on running costs.

## **A CLEANER ENVIRONMENT**

Modern heaters have the option of electronic filtration. This means that all the air in your house could be electronically cleaned up to 6 times per hour. The filter removes 95% of all airborne particles down to 1 micron. Pollen is approx 100 microns and tobacco smoke is 1 micron. This will provide a cleaner healthier home environment which is especially beneficial for hay fever sufferers and those with respiratory complaints.

## **REGISTERS & GRILLES**

If your existing air vents have been painted during decoration over the years, it is possible that the free area could be reduced by as much as 50%. Why not replace them using the new pressed steel range from Johnson & Starley.

## **HOT WATER**

Most modern air heaters now offer the option of an integral domestic hot water circulator. Mounted within the air heater it provides efficient and economical hot water. Larger output circulators are available on some models to supply hot water to radiators as well as domestic hot water.

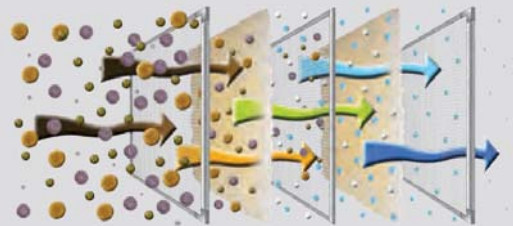

# Cleanflow

## Air Cleaner

### FEATURES

When your air heater is operating on maximum load, all of the air within the dwelling passes across the air filter 6 times per hour.

This presents the perfect opportunity to electronically clean the air and remove smaller particles such as pollen, mould and tobacco smoke.

## Cleanflow Benefits

**Cleanflow** creates a clean healthy indoor environment and is particularly beneficial to bronchial sufferers.

**Cleanflow** will remove 95% of particles down to 1 micron. The illustration alongside shows various particles magnified 1000 times.

**Cleanflow** Electronic Air Cleaner is only available from Johnson & Starley Ltd.

# UPGRADE TODAY

**Johnson & Starley** are Europe's leading specialist manufacturer of air heaters and have been in existence for 90 years.

Our current range of heaters offer a replacement for any gas fired or electric air heater in the market. Modern heaters are quiet in operation, fuel efficient and offer additional benefits such as:

- Heater replacement is a quick and easy operation with work generally confined to the heater cupboard.
- Modern heaters with electronic controls provide improved comfort conditions and are more fuel efficient.
- Modern heaters provide very quick warm up times and are therefore probably the most controllable heating systems available.
- Modern registers and grilles can improve appearance as well as performance of the heating system.
